

### Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

#### Listing of Claims:

1. (currently amended) A medical device for delivering a medicament to a patient, comprising:

a syringe assembly comprising:

a barrel having a forward end and a rear end and defining a reservoir within which the medicament may be contained;

a needle cannula having a forward tip and being coupled to said forward end of said barrel and in fluid communication with said reservoir; and

a plunger having a first end with a stopper positioned in said reservoir and a second end having a thumb pad for receiving medicament delivery pressure for causing said plunger to move within said reservoir to ~~cause expel~~ the medicament ~~to be expelled~~ from said reservoir;

a shield releasably mounted on a front portion of said barrel at a first position; and

an urging member for urging said shield in a forward direction relative to said syringe assembly, wherein one of said shield and said barrel defines a track arrangement having an entry track ~~and a lock-out track, said lock-out track having first and second ends, said entry track and said lock-out track being~~ having an end joined to a lockout track at an intersection, a first portion of said lockout track extending beyond said intersection to ~~said a first end of said~~ lockout track and a second portion of said lockout track extending beyond said intersection to ~~said a second end of said lockout track,~~ and the other of said shield and said barrel includes a pin arranged on a resilient lever arm and guidable in said track arrangement, said shield being movable by interaction with an area proximate a needle cannula insertion point on a patient's skin from said first position to a second position against the urgency of said urging member when said needle cannula is inserted into a patient for delivery of the medicament, said pin moving from a first pin position along said entry track at least to the intersection and into a second pin position in said lock-out track during movement of said shield from the first position to the second position, and said shield being moveable from said second position to a third

position by the urgency of said urging member upon removal of said needle cannula from said patient, said pin moving along said lockout track from said second pin position to a third pin position solely by the urgency of said urging member during movement of said shield from said second position to said third position, wherein said forward tip of said needle cannula is covered by said shield when said shield is in said third position, wherein said one of said shield and said barrel further comprises a blocking element arranged at said end of said entry track proximate said intersection, said blocking element having a fixed blocking surface facing said lock-out track and blocking reentry of said pin into said entry track from said lock-out track.

2. (original) The medical device of claim 1, further comprising means for preventing said shield from moving back to said first position after said shield is moved to said second position.

3.-5. (canceled)

6. (previously presented) The medical device of claim 1, wherein said pin is arranged proximate said free end of said lever arm.

7. (canceled)

8. (currently amended) The medical device of claim [[7]] 1, wherein said blocking element further comprises an inclined surface facing said entry track, said pin sliding over said inclined surface and bending said resilient lever as said pin slides over said inclined surface, thereby allowing movement of said shield from said entry track toward said lock-out track.

9. (previously presented) The medical device of claim 1, wherein said one of said shield and barrel comprises a locking device for locking the shield in said third position.

10. (previously presented) The medical device of claim 9, wherein said lock-out track is defined between first and second end surfaces at the first and second ends thereof,

said pin being guided toward said first end when said shield is moved toward said third position, said locking device comprising a one-way step arranged proximate said first end of said lock-out track such that said pin is arranged between said one-way step and said first end surface when said shield is in said third position.

11. (previously presented) The medical device of claim 10, wherein said one-way step comprises a blocking surface facing said first end of said lock-out track, said blocking surface preventing said pin from moving from said first end toward said second end and thereby locking said shield in said third position.

12. (previously presented) The medical device of claim 11, wherein said one-way step comprises an inclined surface facing said second end of said lock-out track, said pin sliding over said inclined surface as said shield moves toward said second position, thereafter allowing movement of said pin toward said first end of said lock-out track.

13. (previously presented) The medical device of claim 1, wherein one of said entry track and said lock-out track extends parallel to a longitudinal axis of said medical device.

14. (original) The medical device of claim 13, wherein said lock-out track extends parallel to the longitudinal axis of said medical device and said entry track extends at least partially in the circumferential direction such that the shield rotates as the shield moves from said first position to said second position.

15. (original) The medical device of claim 13, wherein said entry track extends parallel to the longitudinal axis of said medical device and said lock-out track extends at least partially in the circumferential direction such that the shield rotates about the longitudinal axis as the shield moves from said second position to said third position.

16. (canceled)

17. (original) The medical device of claim 1, wherein said urging member is a spring.

18. (original) The medical device of claim 1, wherein said barrel is plastic.

19. (original) The medical device of claim 1, wherein said barrel is glass.

20. (previously presented) The medical device of claim 1, wherein said barrel comprises a cylindrical portion extending forward of said reservoir, said cylindrical portion defining said track arrangement.

21. (original) The medical device of claim 20, wherein said cylindrical portion is formed unitarily with said barrel.

22. (original) The medical device of claim 20, wherein said cylindrical portion is plastic and a remainder of said barrel is glass.

23. (previously presented) The medical device of claim 1, wherein said pin comprises a radial projection.

24. (currently amended) The medical device of claim 1, wherein said one of said shield and said barrel comprises two of said track arrangements arranged on opposing sides of said one of said shield and said barrel and the other of said shield and said barrel comprises two pins guidably inserted in respective ones of said two track arrangements, wherein the forward ends of said lockout tracks are axially offset so that said shield is held askew relative to said needle cannula by the urgency of said urging member when said shield is in the third position.

25. (currently amended) A combination comprising a medical syringe and a safety shield assembly, said medical syringe comprising a barrel having a forward end and a rear end and defining a reservoir within which the medicament may be contained, a needle cannula

having a forward tip and being coupled to said forward end of said barrel and in fluid communication with said reservoir, and a plunger having a first end with a stopper positioned in said reservoir and a second end having a thumb pad for receiving medicament delivery pressure for causing said plunger to move within said reservoir to cause the medicament to be expelled from said reservoir; and

said safety shield assembly comprising a shield releasably mounted on a front portion of said barrel at a first position, and an urging member for urging said shield in a forward direction relative to said barrel, wherein one of said shield and said barrel defines a track arrangement having an entry track ~~with an end and a lock-out track, said lock-out track having first and second ends, said entry track and said lock-out track being joined to a lockout track~~ at an intersection, a first portion of said lockout track extending beyond said intersection to said ~~a~~ first end ~~of said lockout track~~ and a second portion of said lockout track extending beyond said intersection to said ~~a~~ second end ~~of said lockout track~~, and the other of said shield and said barrel includes a radial projection arranged on a resilient lever arm and guidably inserted in said track arrangement, said shield being movable by interaction with an area on a patient's skin proximate a needle cannula insertion point from said first position to a second position against the urgency of said urging member when said needle cannula is inserted into a patient for delivery of the medicament, said radial projection moving from a first projection position along said entry track at least to the intersection and into a second projection position in said lock-out track during movement of said shield from the first position to the second position, and said shield being moveable from said second position to a third position by the urgency of said urging member upon removal of said needle cannula from said patient, wherein said forward tip of said needle cannula is covered by said shield when said shield is in said third position, said radial projection moving in said lock-out track from said second projection position to a third projection position solely by the urgency of said urging member during movement of said shield from the second position to the third position, wherein said one of said shield and said barrel further comprises a blocking element arranged at said end of said entry track proximate said intersection, said blocking element having a fixed blocking surface facing said lock-out track and blocking reentry of said pin into said entry track from said lock-out track.

27. (original) The combination of claim 25, wherein said barrel is plastic.

28. (original) The combination of claim 25, wherein said barrel is glass.

29. (original) The combination of claim 25, wherein said barrel comprises a cylindrical portion extending forward of said reservoir, said cylindrical portion defining said track arrangement.

30. (original) The combination of claim 29, wherein said cylindrical portion is formed unitarily with said barrel.

31. (original) The combination of claim 29, wherein said cylindrical portion is plastic and the remainder of said barrel is glass.

32. (currently amended) A shield assembly for connection to a syringe barrel for preventing inadvertent needle sticks after use of the syringe, the shield system comprising a cylindrical portion connectable to a front end of the syringe barrel, a shield releasably mounted on said cylindrical portion at a first position, and an urging member for urging said shield in a forward direction relative to the syringe barrel, wherein one of said shield and said cylindrical portion defines a track arrangement having an entry track ~~and a lock-out track, said lock-out track having first and second ends, said entry track and said lock-out track being~~ with an end joined to a lockout track at an intersection, a first portion of said lockout track extending beyond said intersection to ~~said a first end of said lockout track~~ and a second portion of said lockout track extending beyond said intersection to ~~said a second end of said lockout track~~, and the other of said shield and said cylindrical portion includes a pin arranged on a resilient lever arm and guidably inserted in said track arrangement, said shield being movable by interaction with an area proximate a needle cannula insertion point on a patient's skin from said first position to a second position against the urgency of said urging member when a needle cannula of the syringe is inserted into a patient for delivery of the medicament, said pin moving from a first pin position along said entry track at least to the intersection and into a second pin position in said lock-out

track during movement of said shield from the first position to the second position, and said shield being moveable from said second position to a third position by the urgency of said urging member upon removal of the needle cannula from the patient to cover the tip of the needle cannula connected to the forward end of the syringe barrel, said pin moving along said lockout track from said second pin position to a third pin position solely by the urgency of said urging member during movement of said shield from said second position to said third position, wherein said one of said shield and said barrel further comprises a blocking element arranged at said end of said entry track proximate said intersection, said blocking element having a fixed blocking surface facing said lock-out track and blocking reentry of said pin into said entry track from said lock-out track.

33. (original) The shield assembly of claim 32, further comprising means for preventing said shield from moving back to said first position after said shield is moved to said second position.

34.-36. (canceled)

37. (previously presented) The shield assembly of claim 32, wherein said pin is arranged proximate said free end of said lever arm.

38. (original) The shield assembly of claim 37, wherein said one of said shield and said cylindrical portion further comprises a blocking element arranged in said entry track proximate said intersection, said blocking element having a blocking surface facing said lock-out track for blocking reentry of said pin into said entry track from said lock-out track.

39. (previously presented) The shield assembly of claim 32, wherein one of said entry track and said lock-out track extends parallel to a longitudinal axis of said medical device.

40. (original) The medical device of claim 39, wherein said lock-out track extends parallel to said longitudinal axis of said medical device and said entry track extends at

least partially in the circumferential direction such that the shield rotates as the shield moves from said first position to said second position.

41. (original) The medical device of claim 39, wherein said entry track extends parallel to said longitudinal axis of said medical device and said lock-out track extends at least partially in the circumferential direction such that the shield rotates as the shield moves from said second position to said third position.

42. (canceled)

43. (currently amended) A medical device for delivering a medicament to a patient, comprising:

a syringe assembly comprising:

a barrel having a forward end and a rear end and defining a reservoir within which the medicament may be contained;

a needle cannula having a forward tip and being coupled to said forward end of said barrel and in fluid communication with said reservoir; and

a plunger having a first end with a stopper positioned in said reservoir and a second end having a thumb pad for receiving medicament delivery pressure for causing said plunger to move within said reservoir to cause the medicament to be expelled from said reservoir;

a shield releasably mounted on a front portion of said barrel at a first position, wherein one of said shield and said barrel defines a track arrangement having an entry track ~~and a lock-out track, said lock-out track having first and second ends, said entry track and said lock-out track being~~ having an end joined to a lockout track at an intersection, a first portion of said lockout track extending beyond said intersection to ~~said a first end of said lockout track~~ and a second portion of said lockout track extending beyond said intersection to ~~said a second end of said lockout track~~, and the other of said shield and said barrel includes a radial projection arranged on a resilient lever arm and guidably inserted in said track arrangement;

means for urging said shield in a forward direction relative to said syringe assembly;

means for retaining said shield in said first position;

means for allowing movement of said shield from said first position to a second position by interaction with a patient's skin and against the urgency of said urging member when said needle cannula is inserted into a patient for delivery of the medicament, said radial projection moving from a first projection position along said entry track at least to the intersection and into a second projection position in said lock-out track during movement of said shield from the first position to the second position; and

means for allowing movement of said shield from said second position to a third position by the urgency of said means for urging upon removal of said needle cannula from said patient, wherein said forward tip of said needle cannula is covered by said shield when said shield is in said third position, said radial projection moving in said lock-out track from said second projection position to a third projection position solely by the urgency of said urging member during movement of said shield from the second position to the third position, wherein said one of said shield and said barrel further comprises a blocking element arranged at said end of said entry track proximate said intersection, said blocking element having a fixed blocking surface facing said lock-out track and blocking reentry of said pin into said entry track from said lock-out track.

44. (previously presented) The medical device of claim 2, wherein said third pin position is at the first end of said lock-out track, and said pin is movable from said second pin position to the second end of said lock-out track after said pin enters said lock-out track at said second position, whereby said means for preventing prevents said pin from entering said entry track before said shield reaches a rearmost position of said shield relative to said syringe assembly.

45. (previously presented) The combination of claim 25, further comprising a blocking element in said entry track preventing said shield from moving back to said first position after said shield is moved to said second position, wherein said third pin position is at one of the ends of said lock-out track, and said pin is movable from said second pin position to the other one of the ends of said lock-out track after said pin enters said lock-out track at said second position, whereby said blocking element prevents said pin from entering said entry track before said shield reaches a rearmost position of said shield relative to said barrel.

46. (previously presented) The shield assembly of claim 32, further comprising a blocking element preventing said shield from moving back to said first position after said shield is moved to said second position, wherein said third pin position is at one of the ends of said lock-out track, and said pin is movable from said second pin position to the other one of the ends of said lock-out track after said pin enters said lock-out track at said second position, whereby said blocking element prevents said pin from entering said entry track before said shield reaches a rearmost position of said shield relative to said syringe barrel.

47. (previously presented) The medical device of claim 43, further comprising means for preventing said shield from moving back to said first position after said shield is moved to said second position, wherein said third pin position is at one of the ends of said lock-out track, and said pin is movable from said second pin position to the other one of the ends of said lock-out track after said pin enters said lock-out track at said second position, whereby said means for preventing prevents said pin from entering said entry track before said shield reaches a rearmost position of said shield relative to said syringe assembly.

48. (new) The combination of claim 25, wherein said one of said shield and said barrel comprises two of said track arrangements arranged on opposing sides of said one of said shield and said barrel and the other of said shield and said barrel comprises two pins guidably inserted in respective ones of said two track arrangements, wherein the forward ends of said lockout tracks are axially offset so that said shield is held askew relative to said needle cannula by the urgency of said urging member when said shield is in the third position.

49. (new) The shield assembly of claim 32, wherein said one of said shield and said barrel comprises two of said track arrangements arranged on opposing sides of said one of said shield and said barrel and the other of said shield and said barrel comprises two pins guidably inserted in respective ones of said two track arrangements, wherein the forward ends of said lockout tracks are axially offset so that said shield is held askew relative to said needle cannula by the urgency of said urging member when said shield is in the third position.

50. (new) The medical device of claim 43, wherein said one of said shield and said barrel comprises two of said track arrangements arranged on opposing sides of said one of said shield and said barrel and the other of said shield and said barrel comprises two pins guidably inserted in respective ones of said two track arrangements, wherein the forward ends of said lockout tracks are axially offset so that said shield is held askew relative to said needle cannula by the urgency of said urging member when said shield is in the third position.
